CAUTELA— L'USO DI COMANDI, AGGIUSTAMENTI O PROCEDIMENTI DIVERSO DA QUELLO QUI SPECIFICATO PUÒ DAR LUOGO AD ESPOSIZIONE A RADIAZIONI PERICOLOSE.

SPECIFICATIONS

System	Compact disc digital audio system
AUDIO CHARACTERISTICS	
Frequency Response	20Hz-18kHz, ± 1 dB
Harmonic Distortion	Less than 0.07% (1kHz)
S/N Ratio	More than 80dB
Wow and Flutter	Quartz precision
Channel Separation	More than 75dB (1kHz)
Output Voltage max.	2Vrms
FUNCTIONS	
Instant Program Selection	Sequential, with MUSIC SKIP ▶▶ and ◀◀ buttons
Index	Sequential, with SEARCH/INDEX ▶▶ and SEARCH/INDEX ◀◀ buttons (Stop mode only)
Forward/back	Forward/back with sound
Program Functions	16 selections
Repeat	All selections all programmed selections

Reset	Press STOP button
Pause	Each selection
Disc Loading	Motor driven horizontal loading
DIGITAL SIGNAL PROCESSING	
Optical Pickup	3-beam laser
Error Correction	CIRC
Sampling Frequency	44.1kHz
D/A Conversion	16-bit linear
Filter	Digital filter + (4-pole LC filter)
GENERAL	
Power Source	120V, 60Hz (CND) (TCA) 220V, 50Hz (EUR) 240V, 50Hz (AUS) (UK) 110/220V, 50/60Hz (EX)
Power Consumption	9 Watts
Dimensions (W×H×D)	435×90×290mm
Weight	3.4kg

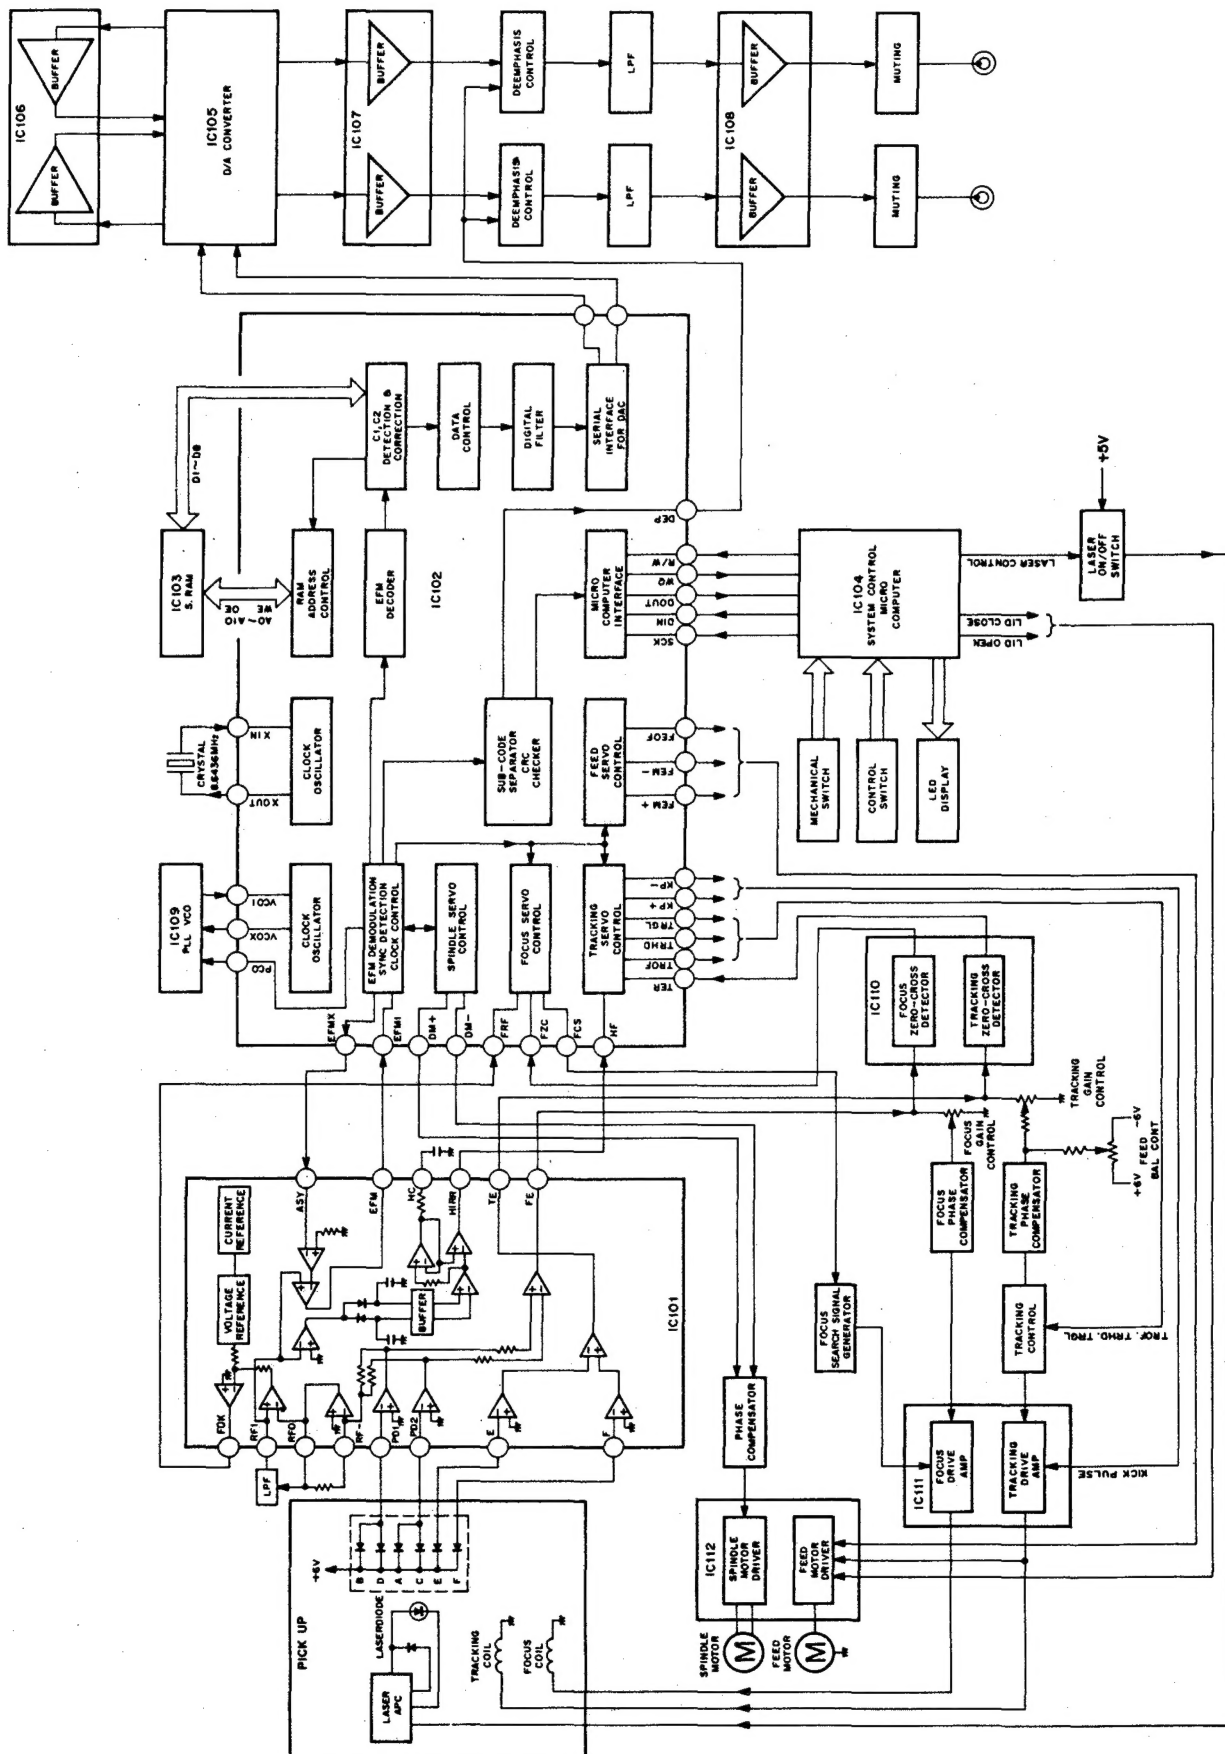

Voltage Conversion (General export models only)

This unit is adjusted to operate at the electric voltage specified on the unit or packing carton. It is necessary to change the voltage requirements of the PD-155 to match your area, use the following procedures.

1. Disconnect the power cord from AC outlet.
2. Locate the voltage selector (AC SELECTOR) on the rear panel of the unit as shown in the illustration.
3. Remove the screw together with the plate then slide the switch to voltage requirement of your area.

FUNCTIONAL BLOCK DIAGRAM

ADJUSTMENT PROCEDURES

CAUTION:

Avoid eye exposure to invisible laser beam which is emitted from laser pickup.

PRECAUTIONS REGARDING ADJUSTMENT

- Adjustment is performed in the indicated order.
- When adjustment is made for one item, check the other items which follow.
- The laser pick-up has already been precisely adjusted. Do not touch its mounting screws or controls.

Do not adjust

- When the diffraction grid is adjusted, remove the mechanism. It is convenient to place an insulating panel on top of the chassis, and then to place the mechanism on top of this. (The wires are connected.)

Insulator Board
(wood, plastic etc.)

- Refer to the adjustment diagram for the test points and adjustment controls.
- The ground point for the measurement equipment is the test point indicated as **GND**.

REQUIRED EQUIPMENTS

- DC Voltmeter
- Dualtrace Oscilloscope
- Frequency Counter
- Signal Generator
- Plastic Screwdriver
- Diffraction Grating Adjustment Jig
- Test Disc (SONY:YEDS4)

CHECKING FOCUS ERROR SIGNAL

Checking the focus error signal of the pick-up allows for an evaluation of the pick-up. Be sure this is carried out before repair.

1. Turn on the power and set the unit to the STOP mode.
2. Connect an oscilloscope between test pin **FE** (TP07) and test pin **GND**. (Set the time axis to 0.5 seconds/division.)
3. Connect the +10V supply voltage to test pin **FOFF** (TP08) through a 47kΩ resistor.

4. Press the OPEN/CLOSE button and place the test disk YEDS4 on the table load. Press the OPEN/CLOSE button again.
5. The waveform shown below is displayed six times on the oscilloscope when the table load closes. Check that the p-p voltage is about 8V and that the top and bottom of the waveform are symmetrical.

(When recorded on a memory scope)

- The waveform appears again if the OPEN/CLOSE button is pressed again. This allows for confirmation to be made. The pick-up is faulty if confirmation cannot be made.

SETTING OF INITIAL POSITION OF VOLUME

- The variable resistors are set to the following initial positions.

P101 (E-F BALANCE)	Mechanical center
P102 (FOCUS OFFSET)	Mechanical center
P103 (TRACKING OFFSET)	Mechanical center
P104 (TRACKING GAIN)	Mechanical center
P105 (FOCUS GAIN)	Mechanical center

FREE RUN FREQUENCY ADJUSTMENT

- Turn on the power and set the unit to the STOP mode.
- Short boss terminals of C114. Connect the frequency counter between test pin **VCO** and test pin **GND** (use probes).
- Rotate the core of the PLL OSC coil (T102) with a plastic screwdriver so that the frequency counter indicates 4.3218MHz.

FOCUS OFFSET ADJUSTMENT

- Turn on the power and set the unit to the STOP mode.
- Connect a DC voltmeter and oscilloscope between test pin **TP07 (FE)** and test pin **GND**.
- Adjust P102 so that the indication on the DC voltmeter and oscilloscope is $0V \pm 10mV$.

TRACKING OFFSET ADJUSTMENT

- Turn on the power and set the unit to the STOP mode.
- Connect a DC voltmeter and oscilloscope between test point **T-COIL (TC)** and test pin **GND**.
- Adjust P103 so that the indication on the DC voltmeter and oscilloscope is $0V \pm 50mV$.

NOTE:

This adjustment should be made again after the adjustment of Tracking Gain.

OBSERVATION OF DIFFRACTION GRID

This unit uses a three beam method for the laser pick-up. The position of the E and F beams of provided pick-up is adjusted in relation to the main beam so that they are in the same line.

The following is the observation procedure. Carefully check when pick-up is replaced.

- Turn on the power, place test disk YEDS4 on the table load and set the unit to the STOP mode.
- Short test pins **TP17** and **TP18**.
- Short test pin **TOFF (TP05)** and test pin **GND**. Pass test pins **E (TP3)** and **F (TP2)** through the band pass filter, and connect to the channels of the dualtrace oscilloscope. The ground is obtained from test point **GND**.

- Press the START button to start the test disc YEDS 4 rotation. (The unit becomes Test Mode.)
- Observe the resurge waveform of the waveform indicated on the oscilloscope.

E-F BALANCE ADJUSTMENT

1. Turn on the power and mount test disk YEDS4 on the table load. Set the unit to the STOP mode.
2. Short test pins **TP17** and **TP18**.
3. Short test pin **TOFF** (TP05) and test pin **GND**, and connect a DC voltmeter and oscilloscope to test pin **TE** (TP04) through the low-pass filter shown below.

6. Remove the short between test pin **TOFF** (TP05) and **GND**, and **TP17** and **TP18**, and play back the fourth selection on YEDS4.
7. Observe the waveform of the signal between test pin **E** and test pin **F** using the dualtrace oscilloscope (Monitored in ALT mode). The beam **E** and beam **F** are in the same pit line if the trigger of waveform **F** is approximately $30\mu s$ behind the point (Position where waveform hollows out) where the waveform **E** is triggered.

The two beam are on the same pit line.
(100mV/DIV : 5 μ Sec/DIV)

4. Press the PLAY button. The disk begins to rotate. The unit is rotating in this state with the tracking servo turned off.
5. Adjust P101 so that the DC voltmeter and oscilloscope is $0V \pm 50mV$.

CONFIRMING JITTER

This procedure can be omitted in the case that no jitter counter is equipped.

1. Turn on the power and mount test disc YEDS4 on the table load, and play the fourth program of the YEDS4.
2. Connecting the jitter counter to the test point **EFM**, make sure that the value of 3T is less than 25nSec.
3. In the case of 25nSec or more, adjust P102.

When observation of the waveform is difficult, the trigger level can be varied.

ADJUSTMENT OF TURNTABLE HEIGHT

This adjustment must be made when the motor is replaced.

1. Attach the turntable so that its top surface is 14.05mm from the top of the chassis.

2. Connect test pin **F-COIL** (FC) to a DC voltmeter and oscilloscope through the low-pass filter.

3. Turn on the power and playback the first selection on test disk YEDS4.
4. Readjust the height of the turntable if the reading on the DC voltmeter is not in the range of $0V \pm 0.35V$. (Increase the height of the turntable when the voltmeter reading is positive, and decrease it when negative.)

ADJUSTMENT OF FOCUS/TRACKING GAIN

The measurement circuit shown the next page is necessary for accurate adjustment of the focus and tracking gain. If this circuit cannot be made, make adjustments using the simplified procedure.

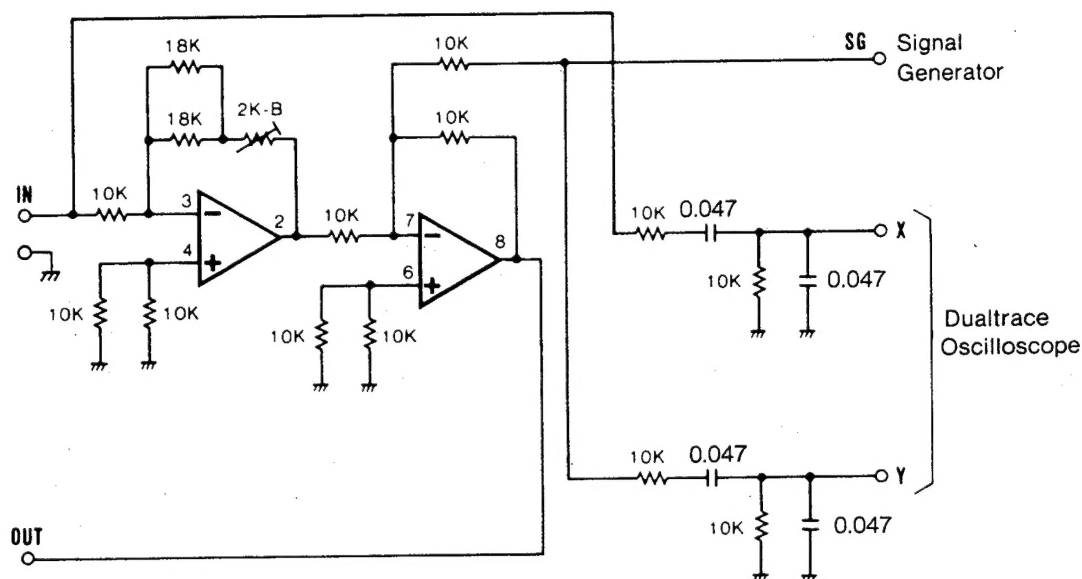

Simplified adjustment procedure

- Focus gain adjustment
P105 is set to a position 15° from its mechanical center as shown in the diagram below.

- Tracking gain adjustment
P104 is set to a position 15° from its mechanical center as shown in the diagram below.

- The IC used is TA7256P
- VR control 2k Ω -B shorts **IN** and **SG**. 1kHz 1Vp-p is supplied from the signal generator, and adjustment is made for minimum output from **OUT**.

Precise adjustment procedure

• Focus gain adjustment

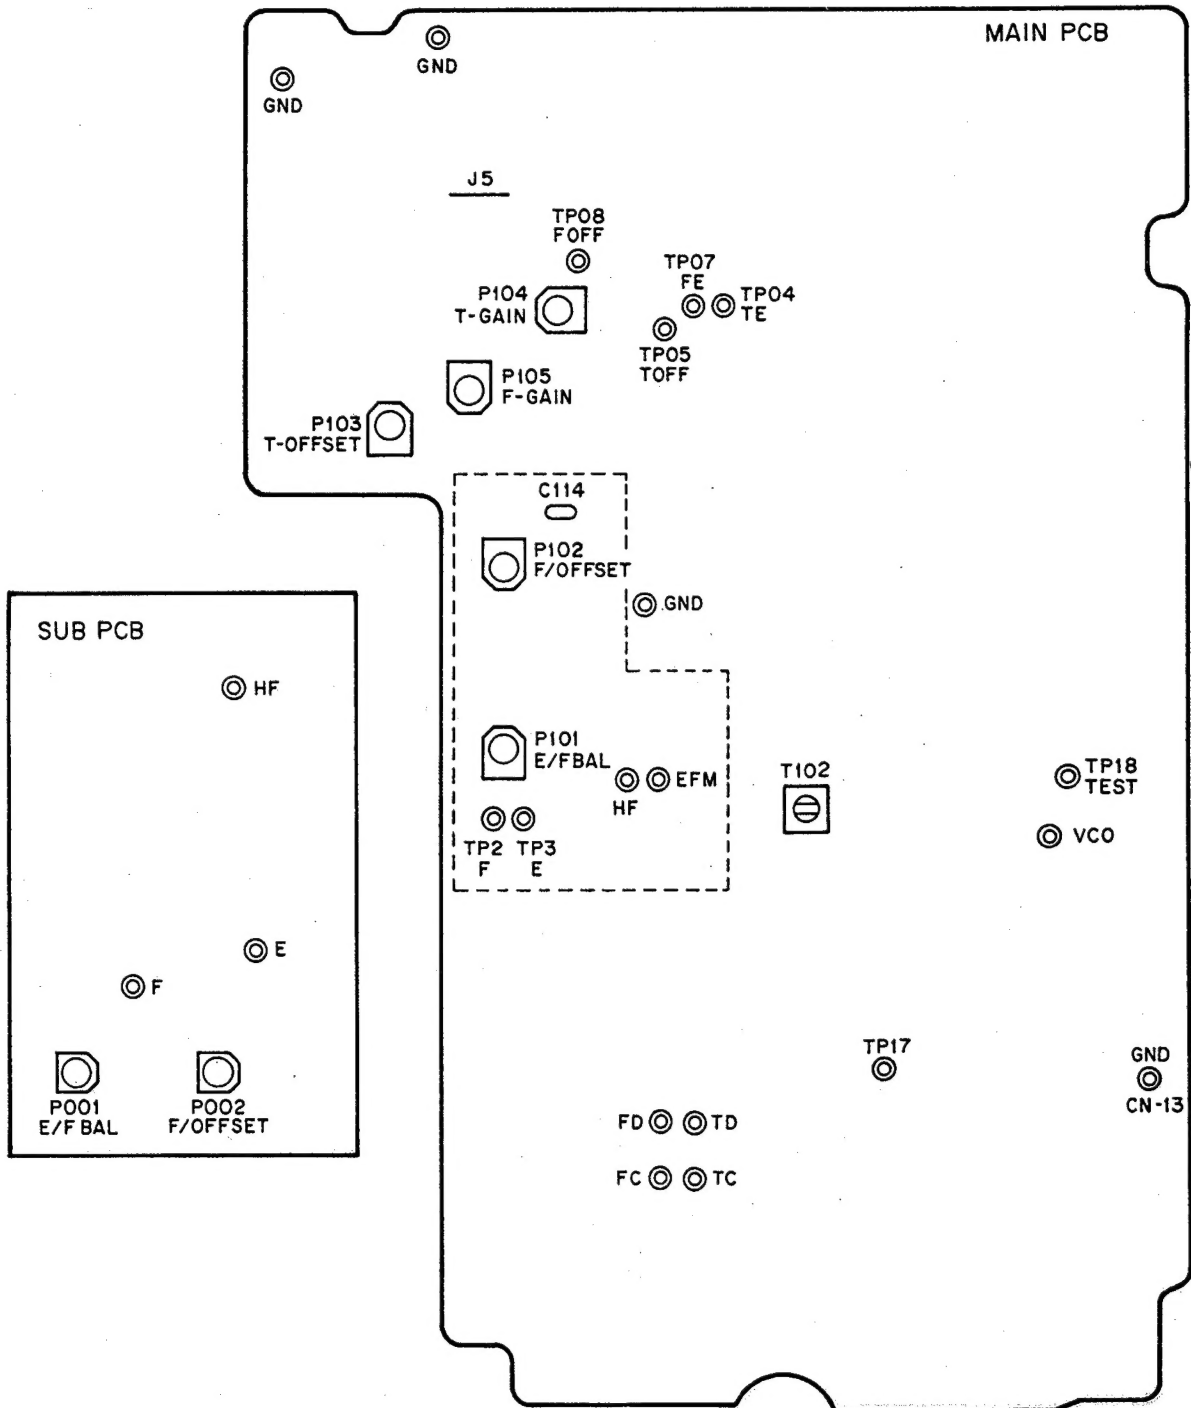

1. Remove the short between test pin **FD** and **FC**, then connect input terminal of the measurement circuit to test pin **FD**, output terminal to test pin **FC** and **GND** to **GND**.
2. Turn on the power, and mount the test disk YEDS4.
3. Playback the first selection on the test disk, and apply a 1,100Hz 0.5Vp-p signal from the signal generator.
4. Observe the resurge waveforms on the oscilloscope, and adjust P105 so that the phase difference of outputs **X** and **Y** from the measurement circuit is 90°.

• Tracking gain adjustment

1. Remove the short between test pin **TD** and **TC**, then connect input terminal of the measurement circuit to test pin **TD**, output terminal to test pin **TC** and **GND** to **GND**.
2. Turn on the power, and mount the test disk YEDS4, and playback the first selection on the disk. The input from the frequency generator is set to 1,200Hz, 0.5Vp-p, and P104 is adjusted so that the phase difference is 90°.

P.C.BOARD ALIGNMENT POINTS

SAFETY INTERLOCK

The Digital Compact Disc Player reads the disc signal by detecting the laser beam. It must be avoided for the human body to directly receive the beam. Especially human eyes are badly affected by the beam. Therefore, the unit is equipped with an interlock to prevent the unnecessary laser outputs.

The laser outputs are controlled by the injection or cutoff of the constant voltage source to the laser diode with Pin 23 of IC 104 (LC6523H). When Pin 23 is in "L" (Low) level, the laser emits the beam. When Pin 23 is in "H" (High) level, the laser does not emit the beam.

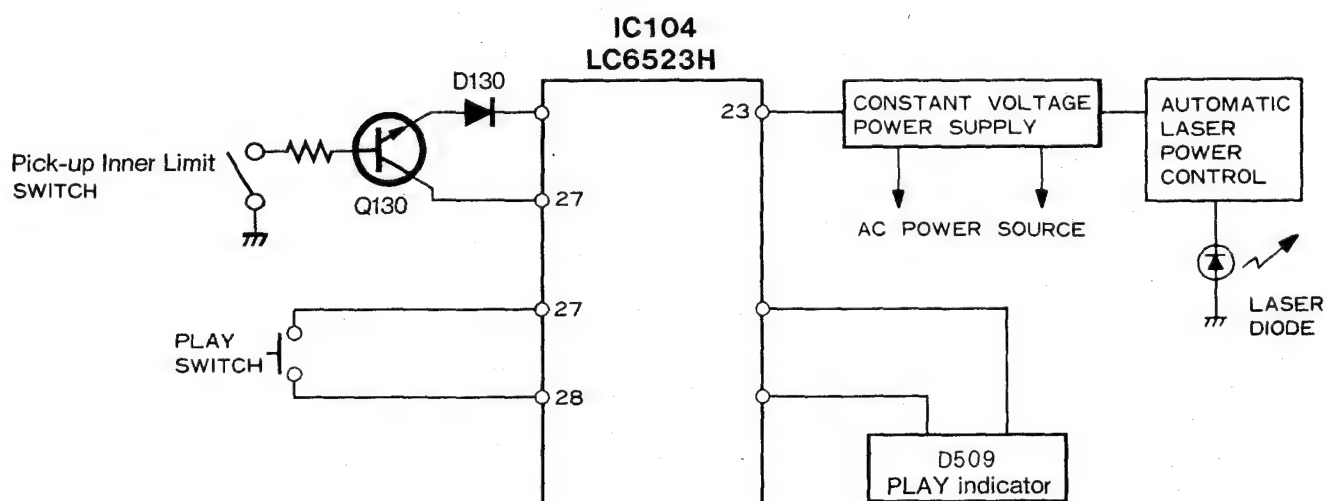

Pin 23 is set in "H" level when the unit is loaded with the disc and it reads the index signals or when the unit is set in the play mode after that. When the unit reads the index signals and the

following two conditions are met, the laser emits the beam.

- 1) When the Pick-up Inner Limit Switch is on. (The disc tray is closed.)
- 2) The pickup is located at the area of the minimum internal circumference.

After the above conditions are met and the index signals have been read, the laser emits the beam when the following two conditions are met.

- 1) When the PLAY button is pressed.
- 2) When the PLAY indicator is on.

NOTES:

1. All resistors values are indicated in "ohm" ($K=10^3$, $M=10^6$).
2. All capacitors values are indicated in " μF " ($P=10^{-12}$).
3. All voltages indicated on the schematics are measured under the following conditions.
 - a. Use a V.T.V.M.
 - b. All voltage
 - c. No signal
 - d. AC input
4. This is a bas

PRODUCT SAFETY NOTICE

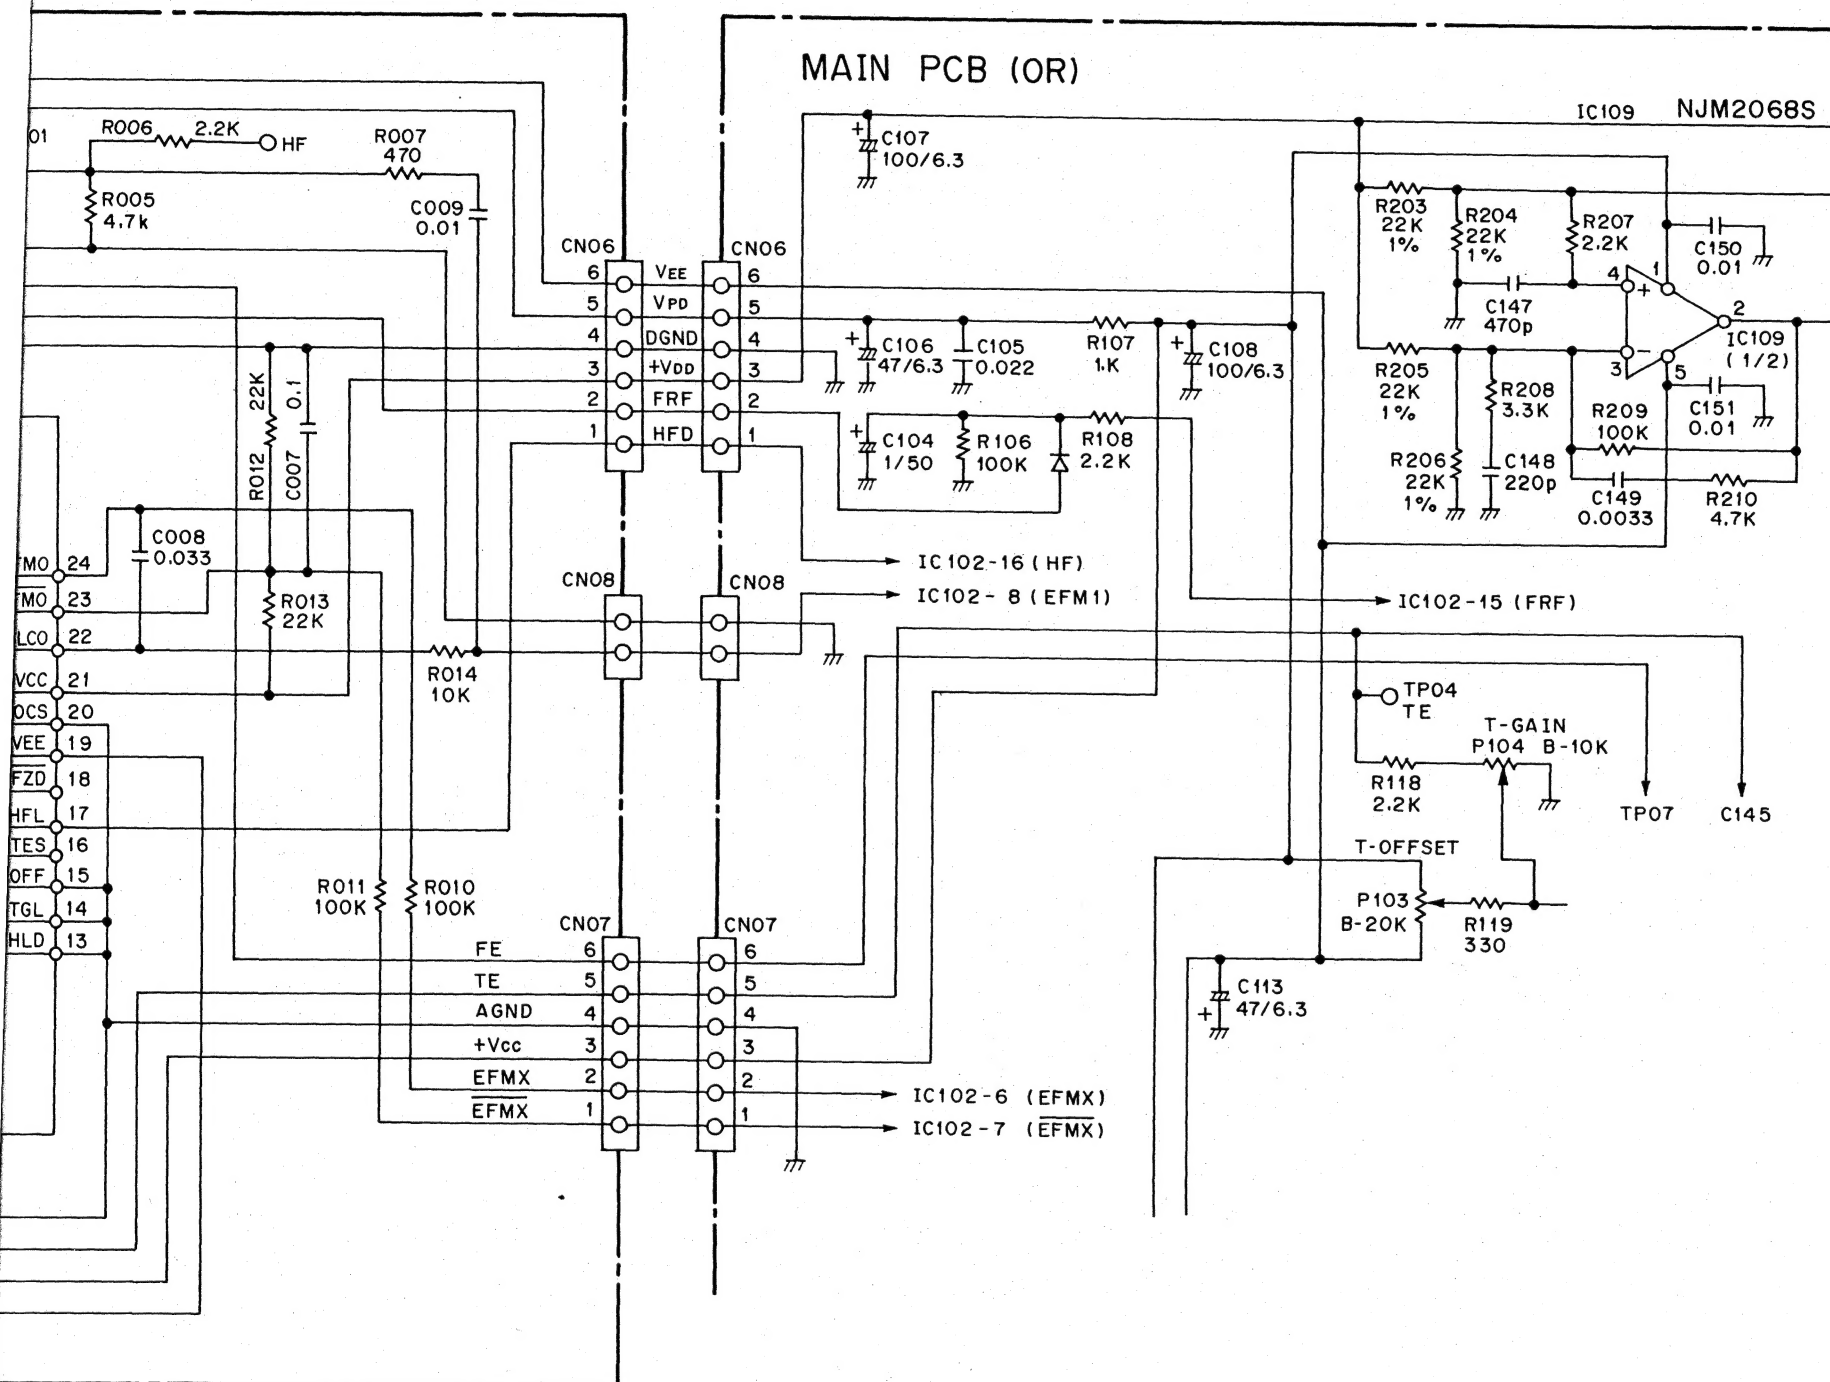

Each precaution in this manual should be followed during servicing. Components identified with the IEC symbol Δ in the parts list and the schematic diagram designate components in which safety can be of special significance. When replacing a component identified with Δ , use only the replacement parts designated, or parts with the same ratings of resistance, wattage or voltage that are designated in the parts list in this manual. Leakage-current or resistance measurements must be made to determine that exposed parts are acceptably insulated from the supply circuit before returning the product to the customer.

All voltages $\pm 10\%$ with respect to chassis ground.
No signals at input terminals.
AC input at 240 volts 50Hz.
This is a basic schematic diagram.
